Note: Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid. (Art. 99(1) European Patent Convention).

Description

[0001] The present invention relates to a flooring panel or wall panel and the use thereof in a wet room.

[0002] During the last few years laminated floors have achieved and increased popularity and on many markets they are beginning to replace parquet floors and wall-to-wall carpets. At the production of laminated floors a decorative thermosetting laminate is first produced. This laminate usually consists of a base layer of paper sheets impregnated with phenol-formaldehyde resin and a decorative surface layer consisting of a decor paper sheet impregnated with melamine-formaldehyde resin. The laminate is produced by pressing the different layers at a high pressure and an increased temperature.

[0003] The laminate obtained is then glued to a carrier of particle board for instance or used as such without any carrier and it is then called compact laminate. The laminated panel thus produced is then sawn up to a number of floor boards which are provided with groove and tongue at the long sides and the short sides. Often the floor boards produced have a thickness of about 7 mm, a length of 120 cm and a width of about 20 cm. Thereby they can usually be put on top of an existing flooring material at a renovation. According to another alternative, instead one or more of the above decorative sheets can be laminated directly towards a base sheet of particle board for instance.

[0004] At the assemblage of such a flooring glue is normally applied in the groove when the floor boards are assembled. Therefore, it will be difficult to change a damaged board or to remove a whole flooring and for instance install it in another room.

[0005] To avoid the above problem efforts have been made to achieve floor boards which can be assembled without glue. One such construction is disclosed in the U.S. patent 5,295,341. There the boards are provided with groove and tongue in the usual way, but here a snap-together system is included in the groove-tongue joint. These floor boards have the disadvantage that the joints between the boards will be flexible and not rigid. This means that if the surface below the floor boards is not completely even which is usually the case, a gap will be formed between the boards. In these gaps dirt and water can penetrate.

[0006] It is the object of the invention to provide a flooring panel or wall panel which can be assembled without glueing but nevertheless gives a rigid connection with water tight joints.

[0007] This subject is solved by a flooring panel or wall panel with the features of claim 1.

[0008] According to the present invention a flooring panel or wall panel, preferably of thermosetting laminate having two pairs of parallel side edges has been brought about. Two of these side edges are provided with a locking means in the form of a groove and the other two with a tongue fitting in the groove whereby a tongue/groove

joint for assembling of the panels is formed. The groove and the tongue are made of a water tight material and formed with a snap-together joint including one or more snapping webs or the like with corresponding cooperating snapping grooves. The groove in front of the snap-together joint has an entrance opening and continues inside the snap-together joint in a stabilizing groove. The tongue is formed with a rear neck intended to fit in the entrance opening and a forwardly protruding stabilizing part situated in front of the snap-together joint and intended for a tight fit in the stabilizing groove, whereby connecting panels when assembled by the snap-together joints and the stabilizing parts in the stabilizing grooves are fixed to each other and prevented from unintentional separation while at the same time a rigid floor covering or wall covering respectively with water tight joints and without unintentional gaps between the panels is obtained.

[0009] According to one preferred embodiment two adjacent side edges of the panel are provided with a groove and the other two side edges with a tongue. At this embodiment the panel is usually rectangular, but it can also be square.

[0010] At square panels it is also possible to provide a pair of parallel sides with a groove and the other pair with a tongue. However, the choice of pattern on the surface layer of the panel is limited at this shape.

[0011] It is preferred that the groove and the tongue are made of thermoplast, a thermosetting laminate, aluminum or a chipboard or particle board impregnated with a thermoplast. Of course also other water tight materials can be used.

[0012] At one embodiment, the groove as well as the tongue are formed as a ledge fixed to the side edges of the panel. Suitably the ledge-formed groove and tongue respectively are then fixed in a recess along the side edges with glue for instance.

[0013] The snapping webs can be formed on the upper and/or lower side of the tongue while fitting snapping grooves are formed in the groove

[0014] In one preferred embodiment one snapping web is formed on the upper side of the tongue and one on the lower side thereof while the groove has two fitting snapping grooves one at the top and one at the bottom.

[0015] If necessary one pair of snapping webs can be formed on the upper side of the tongue and one pair on the lower side thereof. Of course you then need two snapping grooves at the top and two snapping grooves at the bottom of the groove to fit with the snapping webs. This construction will give an extremely strong joint

[0016] Of course the snapping webs can instead be arranged in the groove and the snapping grooves on the tongue.

[0017] In one preferred embodiment the width of the stabilizing part is 2-10 mm, preferably 4-10 mm. Generally a wider stabilizing part with fitting stabilizing groove gives a better rigidity of the assembled panels.

[0018] The stabilizing part will also assist in a correct

assemblage of the panels. Thus, when the stabilizing part moves into the stabilizing groove you get a correct level of the panels and the panels can easily be pushed into the correct position where you do not have any gap between the panels. Of course without any substantial gap between the panels water and dirt are prevented from entering the assembled flooring or wall covering.

[0019] As a safe guard against water penetration a seal might be arranged in the inner part of the stabilizing groove for instance.

[0020] Preferably the grooves and the tongues run the full length of the side edges of the panels.

[0021] The panels can be designed in such a manner that the under side of the groove and the tongue are situated in the same level as the under side of the panel.

[0022] The panels can be used for covering floors and walls in ordinary dry rooms. However, due to the rigid and water tight joints the panels can be used also for wet rooms. For such applications the whole panel is preferably made of thermosetting laminate of so-called compact laminate type. Such a laminate does not absorb water.

[0023] Another alternative is a non water absorbing base with a water tight surface. The surface may for instance consist of paint, a thermoplastic foil such as polyethylene, polypropylene or polyvinyl chloride, a paper sheet impregnated with thermosetting resin or of a thermosetting laminate.

[0024] One suitable non water absorbing base is a board produced by pressing wood particles or wood chips impregnated with a thermoplastic.

[0025] The invention will be further explained in connection with the enclosed figures of which figure 1 schematically shows a panel 1 according to the invention seen from above. The panel is drawn with a rectangular shape but it can as well be square. Figures 2 and 3 show a cross section through two adjacent edges of two embodiments of a panel where two such panels are to be assembled. The construction according to figure 2 is preferred.

[0026] The panel 1 consists of a base of wood particles impregnated with a thermoplastic with a decorative thermosetting laminate as a surface layer 17 glued on top.

[0027] The panel 1 has two pairs of parallel side edges 2, 3 and 4, 5 respectively (Fig. 1). Two of these side edges are provided with locking means in the form of a groove 6 and the other two with a tongue 7 fitting in the groove 6, whereby a tongue/groove joint for assembling of the panels is formed.

[0028] The groove 6 and the tongue 7 are made of a water tight material and formed with a snap-together joint. In the embodiment shown in figure 2 the snap-together joint consists of two snapping webs 9, one on the upper side of the tongue 7 and one on the lower side of tongue, these webs 9 cooperating with two fitting snapping grooves 10.

[0029] In front of the snap-together joint, which means

the snapping webs 9 and the snapping groove 10, the groove 6 has an entrance opening 8. Inside the snap-together joint the groove 6 continues in a stabilizing groove 13.

5 [0030] The tongue 7 is formed with a rear neck 11 intended to fit in the entrance opening 8 of the groove 6. In front of the snap-together joint the tongue 7 has a forwardly protruding stabilizing part 12 intended for a tight fit in the stabilizing groove 13.

10 [0031] The parts 9 and 10 included in the snap-together joint are also adapted to each other to give a tight fit and strong joint. To increase this effect further the snapping grooves 10 are provided with undercut edges 18 which cooperate with the backside of the snapping webs 9 with the same undercut.

15 [0032] The groove 6 and the tongue 7 are made of thermosetting laminate and formed as a ledge fixed by glue in a recess along the side edges of the panel. The under side 14 of the groove 6 is situated in the same level as the under side 15 of the panel and the under side 16 of the tongue 7 is situated in the same level as the under side 15 of the panel 1.

20 [0033] When connecting panels have been assembled by the snap-together joints and the stabilizing parts 12 inserted in the stabilizing grooves 13, the panels are fixed to each other and prevented from unintentional separation. A rigid floor covering or wall covering with water tight joints and without unintentional gaps between the panels is obtained. The usual rotation of the snapping webs 9 in the snapping grooves 10 is prevented by the stabilizing parts 12 in the stabilizing grooves 13. Accordingly these parts are essential for the possibility to get a rigid joint between the panels.

25 [0034] The embodiment shown in figure 3 is very similar to that according to figure 2. The difference is that only the under side of the tongue 7 is provided with a snapping web 9. The upper side is lacking a snapping web. Accordingly there is only one snapping groove 10 at the bottom of the groove 6.

30 [0035] The invention is not limited to the embodiments shown since these can be modified in different ways within the scope of the invention.

35 Claims

1. Flooring panel or wall panel, preferably of thermosetting laminate having two pairs of parallel side edges (2, 3 and 4, 5 respectively), two of these side edges being provided with a locking means in the form of a groove (6) and the other two with a tongue (7) fitting in the groove (6) whereby a tongue groove joint for assembling of the panels is formed, wherein the groove (6) and the tongue (7) are formed with a snap-together joint including one or more snapping protrusions (9) formed on the upper side as well as on the lower side of the tongue (7) and corresponding cooperating fitting snapping grooves (10)

- formed in the groove (6) characterized in that the groove (6) and the tongue (7) form a water tight joint and that the groove (6) has an entrance opening (8) situated towards the adjacent side panel or wall panel relative to the snap-together joint and continues in a stabilizing groove (13) inside the snap-together joint, that the tongue (7) is formed with a rear neck (11) intended to fit in the entrance opening (8) and a forwardly protruding stabilizing part (12) intended for a tight fit in the stabilizing groove (13), whereby connecting panels (1) when assembled by the snap-together joints and the stabilizing parts (12) in the stabilizing grooves (13) are fixed to each other and prevented from unintentional separation while at the same time a rigid floor covering or wall covering respectively without unintentional gaps between the panels is obtained.
2. Panel according to claim 1, **characterized** in that two adjacent side edges (2, 4) are provided with a groove (6) and the other two side edges (3, 5) with a tongue (7).
 3. Panel according to claim 1 or 2, comprising a non-water absorbing base with a water tight surface layer.
 4. Panel according to claim 3, **characterized** in that the surface layer consists of paint, a thermoplastic foil such as polyethylene, polypropylene or polyvinyl chloride, a paper sheet impregnated with a thermosetting resin or a thermosetting laminate.
 5. Panel according to claim 3 or 4, **characterized** in that the base consists of a board produced by pressing wood particles or wood chips impregnated with a thermoplastic.
 6. Panel according to any one of claims 1-5, **characterized** in that the groove (6) as well as the tongue (7) are made of a water tight material, such as thermoplast, a thermosetting laminate, a chipboard or a particle board impregnated with a thermoplast, aluminum or the like.
 7. Panel according to any one of claims 1-6, **characterized** in that the groove (6) as well as the tongue (7) are formed as a ledge fixed to the side edges of the panel.
 8. Panel according to any one of claims 1-7, **characterized** in that the ledge formed groove (6) and tongue (7) respectively are fixed in a recess along the side edges.
 9. Panel according to any one of claims 1-8, **characterized** in that one snapping web (9) is formed on the upper side of the tongue (7) and one on the lower side thereof, while the groove (6) has two fitting snapping grooves (10) one at the top and one at the bottom.
 10. Panel according to any one of claims 1-9, **characterized** in that the width of the stabilizing part (12) is 2-10 mm, preferably 4-10 mm.
 11. Panel according to any one of claims 1-10, **characterized** in that the under side (14) of the groove (6) is situated in the same level as the under side (15) of the panel (1).
 12. Panel according to any one of claims 1-11, **characterized** in that the under side (16) of the tongue (7) is situated in the same level as the under side (15) of the panel (1).
 13. Panel according to any one of claims 1-12, **characterized** in that the inner part of the stabilizing groove (13) is provided with a seal for improvement of the water tightness.
 14. Use of a panel according to any one of claims 1-13 for covering the floor and/or the walls of a wet room.
 15. Use according to claim 14, **characterized** in that the panel is made of the thermosetting laminate of so-called compact laminate type or of a non water absorbing base with a surface layer (17) consisting of paint, a thermoplastic foil, a paper sheet impregnated with thermosetting resin or of a thermosetting laminate.
 16. Use according to claim 15, **characterized** in that the base under the surface layer consists of a board produced by pressing wood particles or wood chips impregnated with a thermoplastic.

Patentansprüche

1. Bodenpaneel oder Wandpaneel, vorzugsweise aus einem aushärtenden Laminat, das zwei Paar von parallelen Seitenkanten (2, 3 und 4, 5 jeweils) hat, wovon zwei dieser Seitenkanten mit einer Eingriffseinrichtung in der Form einer Nut (6) und die anderen zwei mit einer Feder (7) versehen sind, die in die Nut (6) passt, wodurch eine Nut-Federverbindung zum Zusammenfügen der Paneele gebildet wird, wobei die Nut (6) und die Feder (7) mit einem Schnappverschluss geformt sind, der einen oder mehrere Schnappvorsprünge (9) umfasst, die auf der oberen Seite ebenso wie auf der unteren Seite der Feder (7) geformt sind, und entsprechende damit zusammenwirkende passende Schnappnuten (10), die in der Nut (6) geformt sind, dadurch gekennzeichnet, dass die Nut (6) und die Feder (7)

- eine wasserdichte Verbindung bilden und dass die Nut (6) eine Eingangsöffnung (8) hat, die in Richtung auf das benachbarte Seitenpaneel oder Wandpaneel relativ zu dem Schnappverschluss angeordnet ist und sich in eine Stabilisiernut (13) in dem Schnappverschluss fortsetzt, dass die Feder (7) mit einem rückwärtigen Hals (11) geformt ist, der dazu gedacht ist, in die Eingangsöffnung (8) zu passen, und einem nach vorne vorstehenden Stabilisierteil (12), das zu einer engen Passung in der Stabilisiernut (13) gedacht ist, wobei verbindende Paneele (1), wenn sie durch die Schnappverschlüsse und Stabilisierteile (12) in den Stabilisiernuten (13) zusammengefügt sind, aneinander befestigt sind und an einer unbeabsichtigten Trennung gehindert werden, wobei gleichzeitig eine steife Bodenabdeckung oder Wandabdeckung jeweils ohne unbeabsichtigte Lücken zwischen den Paneelen erzielt wird.
2. Paneel nach Anspruch 1, dadurch gekennzeichnet, dass zwei benachbarte Seitenkanten (2, 4) mit einer Nut (6) versehen sind und die anderen zwei Seitenkanten (3, 5) mit einer Feder (7).
 3. Paneel nach Anspruch 1 oder 2, umfassend eine Wasser nicht absorbierende Basis mit einer wasserdichten Oberflächenschicht.
 4. Paneel nach Anspruch 3, dadurch gekennzeichnet, dass die Oberflächenschicht aus Farbe, einer thermoplastischen Folie, wie Polyethylen, Polypropylen oder Polyvinylchlorid, einer Papierschicht, die mit einem aushärtenden Harz oder einem aushärtenden Laminat imprägniert ist, besteht.
 5. Paneel nach Anspruch 3 oder 4, dadurch gekennzeichnet, dass die Basis aus einem Karton besteht, der durch Pressen von Holzpartikeln oder Holzschnitzeln hergestellt wird, die mit einem Thermoplast imprägniert sind.
 6. Paneel nach einem der Ansprüche 1 bis 5, dadurch gekennzeichnet, dass die Nut (6) ebenso wie die Feder (7) aus einem wasserdichten Material gefertigt ist, wie einem Thermoplast, einem aushärtenden Laminat, einer Spanplatte oder einer Holzspanplatte, die mit einem Thermoplast, Aluminium oder ähnlichem imprägniert ist.
 7. Paneel nach einem der Ansprüche 1 bis 6, dadurch gekennzeichnet, dass die Nut (6) ebenso wie die Feder (7) als eine Leiste geformt ist, die an den Seitenkanten des Paneels befestigt ist.
 8. Paneel nach einem der Ansprüche 1 bis 7, dadurch gekennzeichnet, als durch eine Leiste geformte Nut (6) und Feder (7) jeweils in einer Aussparung entlang den Seitenkanten fixiert ist.
 9. Paneel nach einem der Ansprüche 1 bis 8, dadurch gekennzeichnet, dass ein Schnappgewebe (9) auf der oberen Seite der Feder (7) und eines auf der unteren Seite geformt ist, wobei die Nut (6) zwei passende Schnappnuten (10), eine oben und eine am Boden, hat.
 10. Paneel nach einem der Ansprüche 1 bis 9, dadurch gekennzeichnet, dass die Breite des stabilisierenden Teils (12) 2-10 mm ist, vorzugsweise 4-10 mm.
 11. Paneel nach einem der Ansprüche 1 bis 10, dadurch gekennzeichnet, dass die untere Seite (14) der Nut (6) sich auf dem gleichen Niveau wie die untere Seite (15) des Paneels (1) befindet.
 12. Paneel nach einem der Ansprüche 1 bis 11, dadurch gekennzeichnet, dass die untere Seite (16) der Feder (7) sich auf dem gleichen Niveau wie die untere Seite (15) des Paneels (1) befindet.
 13. Paneel nach einem der Ansprüche 1 bis 12, dadurch gekennzeichnet, dass der innere Teil der Stabilisiernut (13) mit einer Dichtung zur Verbesserung der Wasserdichtheit versehen ist.
 14. Verwendung eines Paneels nach einem der Ansprüche 1 bis 13, zum Bedecken des Bodens und/oder der Wände eines nassen Raums.
 15. Verwendung nach Anspruch 14, dadurch gekennzeichnet, dass das Paneel aus dem aushärtenden Laminat des sogenannten Kompaktaminattyps oder aus einer nicht wasserabsorbierenden Basis mit einer Oberflächenschicht (17) gefertigt ist, die aus Farbe, einer thermoplastischen Folie, einer Papierschicht, die mit aushärtendem Harz imprägniert ist oder aus einem aushärtenden Laminat, besteht.
 16. Verwendung nach Anspruch 15, dadurch gekennzeichnet, dass die Basis unter der Oberflächenschicht aus einem Karton besteht, der durch Pressen von Holzpartikeln oder Holzschnitzeln hergestellt ist, die mit einem Thermoplast imprägniert sind.
- 50 Revendications**
1. Panneau de sol ou panneau mural, de préférence en stratifié thermodurcissable comportant deux paires de bords latéraux parallèles (2, 3 et 4, 5, respectivement), deux de ces bords latéraux étant munis de moyens blocage de sous la forme d'une rainure (6) et les deux autres étant munis d'une languette (7) s'insérant dans la rainure (6) de sorte

- qu'un raccord à languette et rainure pour l'assemblage des panneaux est formé, dans lequel la rainure (6) et la languette (7) sont formées par un raccord à enclenchement mutuel comprenant une ou plusieurs saillies d'enclenchement (9) formées sur le côté supérieur de même que sur le côté inférieur de la languette (7) et des rainures d'assemblage par enclenchement coopérant correspondantes (10) formées dans la rainure (6), caractérisé en ce que la rainure (6) et la languette (7) forment un assemblage étanche à l'eau et en ce que la rainure (6) comporte une ouverture d'entrée (8) située vers le panneau latéral ou panneau mural adjacent par rapport au raccord à enclenchement mutuel et se prolonge dans une rainure stabilisatrice (13) à l'intérieur du raccord à enclenchement mutuel, en ce que la languette (7) comporte un collet arrière (11) destiné à être inséré dans l'ouverture d'entrée (8) et une partie stabilisatrice (12), dépassant vers l'avant, destinée à être insérée étroitement dans la rainure stabilisatrice (13), de sorte que des panneaux de raccord (1) une fois assemblés par les raccords à enclenchement mutuel et les parties stabilisatrices (12) dans les rainures stabilisatrices (13) sont fixés l'un à l'autre et ne peuvent pas se séparer de façon involontaire tandis qu'en même temps un revêtement de sol ou revêtement mural rigide respectivement sans espaces non voulus entre les panneaux est obtenu.
2. Panneau selon la revendication 1, caractérisé en ce que deux bords latéraux adjacents (2, 4) comportent une rainure (6) et les deux autres bords latéraux (3, 5) comportent une languette (7).
 3. Panneau selon la revendication 1 ou 2, comprenant une base n'absorbant pas l'eau avec une couche superficielle étanche à l'eau.
 4. Panneau selon la revendication 3, caractérisé en ce que la couche superficielle est faite de peinture, d'une feuille thermoplastique comme de polyéthylène, de polypropylène ou de poly(chlorure de vinyle), d'une feuille de papier imprégnée d'une résine thermodurcissable ou d'un stratifié thermodurcissable.
 5. Panneau selon la revendication 3 ou 4, caractérisé en ce que la base est faite d'un panneau fabriqué en comprimant des particules de bois ou des copeaux de bois imprégnés d'un thermoplastique.
 6. Panneau selon l'une quelconque des revendications 1 à 5, caractérisé en ce que la rainure (6) de même que la languette (7) sont faites d'un matériau étanche à l'eau, tel qu'un thermoplastique, un stratifié thermodurcissable, un panneau de copeaux ou un panneau de particules imprégné d'un thermoplastique, d'aluminium ou équivalent.
 7. Panneau selon l'une quelconque des revendications 1 à 6, caractérisé en ce que la rainure (6) de même que la languette (7) sont formées comme un rebord fixé aux bords latéraux du panneau.
 8. Panneau selon l'une quelconque des revendications 1 à 7, caractérisé en ce que la rainure (6) et la languette (7) forment rebord respectivement des fixées dans une cavité le long des bords latéraux.
 9. Panneau selon l'une quelconque des revendications 1 à 8, caractérisé en ce qu'une bande d'enclenchement (9) est formée sur le côté supérieur de la languette (7) et une sur son côté inférieur, tandis que la rainure (6) comporte deux rainures d'assemblage par enclenchement (10) une en haut et une en bas.
 10. Panneau selon l'une quelconque des revendications 1 à 9, caractérisé en ce que la partie stabilisatrice (12) a une largeur allant de 2 à 10 mm, de préférence de 4 à 10 mm.
 11. Panneau selon l'une quelconque des revendications 1 à 10, caractérisé en ce que le côté inférieur (14) de la rainure (6) est situé au même niveau que le côté inférieur (15) du panneau (1).
 12. Panneau selon l'une quelconque des revendications 1 à 11, caractérisé en ce que le côté inférieur (16) de la languette (7) est situé au même niveau que le côté inférieur (15) du panneau (1).
 13. Panneau selon l'une quelconque des revendications 1 à 12, caractérisé en ce que la partie intérieure de la rainure stabilisatrice (13) est munie d'un joint pour améliorer l'étanchéité à l'eau.
 14. Utilisation d'un panneau selon l'une quelconque des revendications 1 à 13 destiné à couvrir le sol et/ou les murs d'une pièce humide.
 15. Utilisation selon la revendication 14, caractérisée en ce que le panneau est fait du stratifié thermodurcissable de type appelé stratifié compact ou d'une base n'absorbant pas l'eau avec une couche superficielle (17) faite de peinture, d'une feuille thermoplastique, d'une feuille de papier imprégnée de résine thermodurcissable ou d'un stratifié thermodurcissable.
 16. Utilisation selon la revendication 15, caractérisée en ce que la base sous la couche superficielle comprend un panneau fabriqué en comprimant des particules de bois ou des copeaux de bois imprégnés d'un thermoplastique.
